interior:
AirControl-System

One for all

clever float

Yes - it's true: With this innovative fishing equipment, you can target any type of fish. From baitfish to a fully grown monster. **Your fishing success will increase.** 👍

- ✓ 4 sizes for different bait loads
- ✓ Fish without lead or additional weights
- ✓ Great casting distance ... even with small bait weights
- ✓ Bite resistance can be adjusted after casting by gentle tapping
- ✓ Float & Dive function
(also suitable for bottom fishing)
- ✓ Clearly visible daylight colors
- ✓ Day and night fishing with a secure glowstick attachment
- ✓ Developed in Germany and manufactured in Europe

„I'm Sabine,
ambassador for
Clever Float.“

4 Sizes in Clearly Visible Daylight Colors*

Micro Float

- Sensitive biting fish fish (e.g. white fish)
- Ideal for catching bait fish
- **For experienced anglers**
- Weight: 8g
- **Bait weight:**
0 - approx. 3g

Mini Float

- From bait fish to medium fish size
- Sensitive biting fish fish (e.g. tench)
- **Preferred for groundfish fishing**
- Casting distances of more than 50m possible
- Weight: 15g
- **Bait weight:**
0 - approx. 6g

Uni Float

- From medium fish size
- Bottom fishing
- **The all-rounder among the Clever Floats**
- Weight: 20g
- **Bait weight:**
0 - approx. 16g

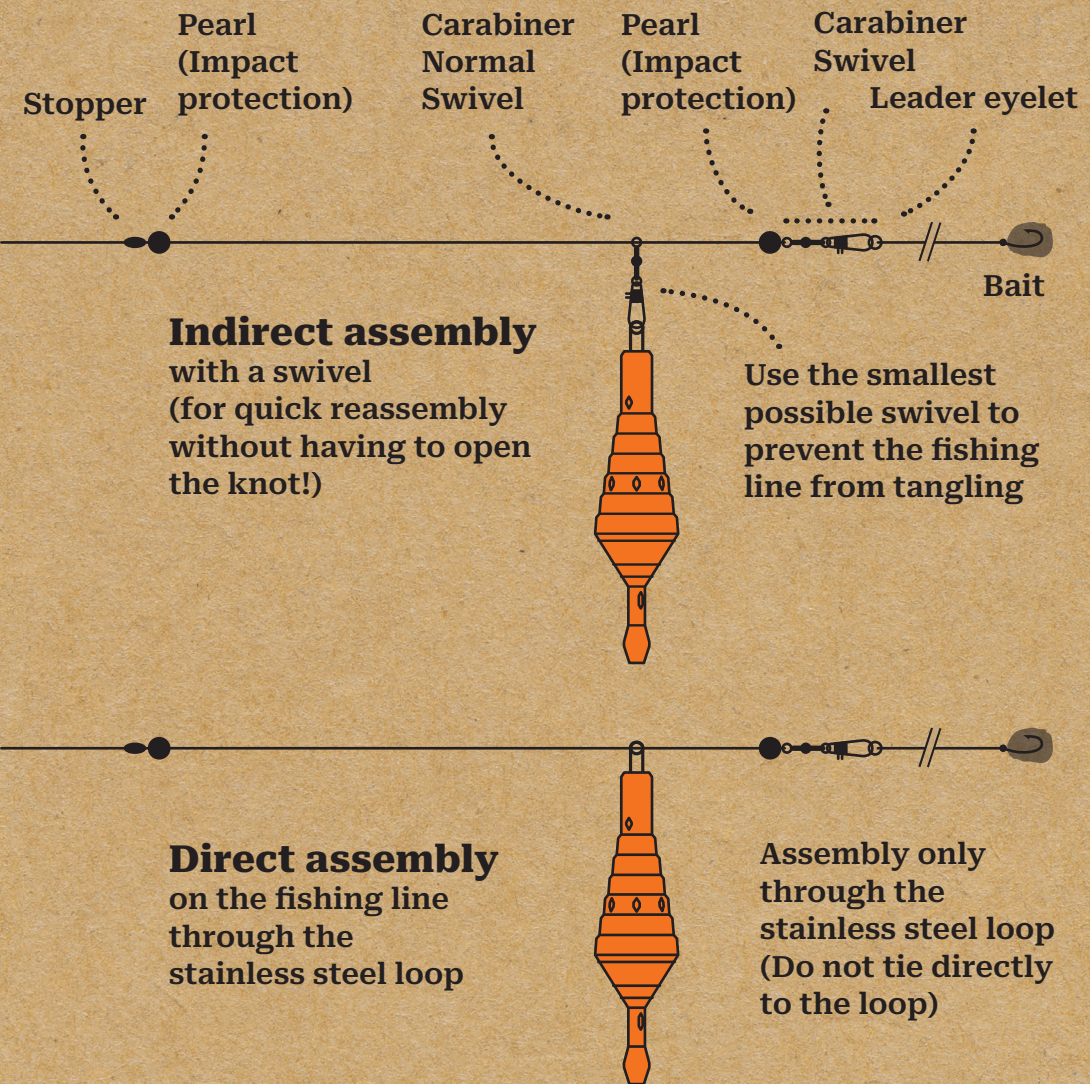

Maxi Float

- **For catching predatory fish** (e.g. pike, zander, catfish)
- **Weight: 25g**
- **Bait weight:**
0 - approx. 26g (e.g. large bait fish, dewworm packages, large dough baits)

*Colors may vary

The CF mounting

The basic setup

The Clever Float must always be set to the desired basic configuration before casting (**never cast it dry**).

The basic setup is done in two steps:

1 Filling by immersion

Only necessary once a day before the first cast.

For the special function of the AirControl system, all Clever Floats must be wetted with water once on the inside **before the first cast**.

2a Mini Float, Uni Float, Maxi Float

Pour out to the desired water fill level

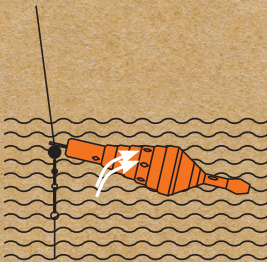

(Water casting weight depending on the action weight of the rod, and the intended casting distance)

2a Micro Float

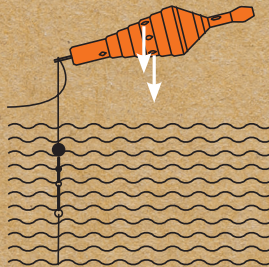

Empty out completely

(the Micro Float does not require any additional water casting weight)

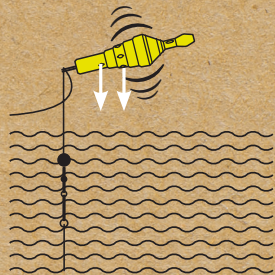

1 Filling by immersion

Mini Float Uni Float Maxi Float 2a Pouring

Micro Float 2a Empty out completely

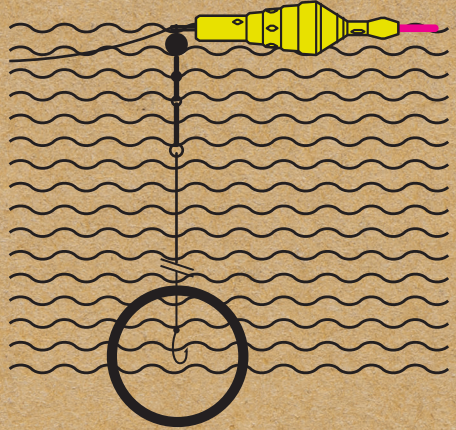

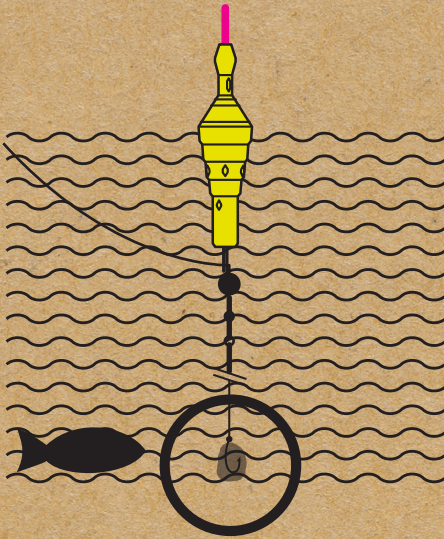

! **Beware of overfilling:** If there is too much water weight, the Clever Float sinks to the bottom.

! **The Clever Floats fill with water when they are pulled in; therefore drain or shake out again before the next cast.** (depending on the bait weight).

clever float

The Micro Float

Due to the small design
the Micro Float reacts very sensitively (... professionals will be pleased).

There is a special benefit with a glowstick:

**When using a glowstick, the centre of gravity shifts upwards
and the Micro Float therefore tips over if the bait is lost. Thanks to
this feedback signal, the rig can be re-baited immediately.**

**Unnecessary and unsuccessful
sitting times are avoided.**

**Without a glowstick, the Micro Float (like the entire product family)
keeps standing even after losing bait.**

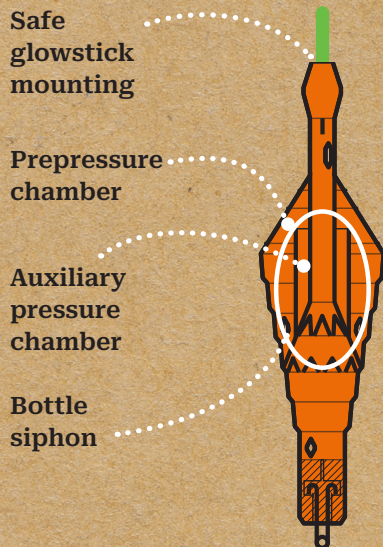

Important note:

Due to its high sensitivity, the Micro Float always needs at least the
leader weight to stand upright. During any tests in the water glass
without mounting and without a glowstick, it will tip over.

**So if you want to test it in advance: Always on the fishing water and
with a rig.**

clever float

The AirControl-System

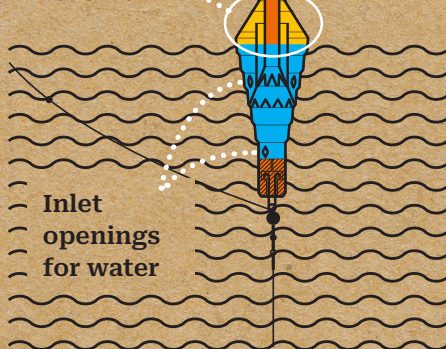

The **AirControl-System** is an ingenious arrangement of pressure chambers and tubes. This has three effects:

1. All types of attachment weights are no longer necessary.
2. The cast weight can be easily adjusted to the individual bait weight
3. The bite resistance can be readjusted after casting down to the minimum (if desired, until it sinks to the bottom).

Open connection to atmospheric pressure in contrast to the water sphere!

Air cushion

The Clever Float automatically levels itself to the predefined height after cast. The bottle siphon encloses an air cushion on which the **Clever Float** literally floats.

Just the Clever Floats work according to the principle of the AirControl-System.

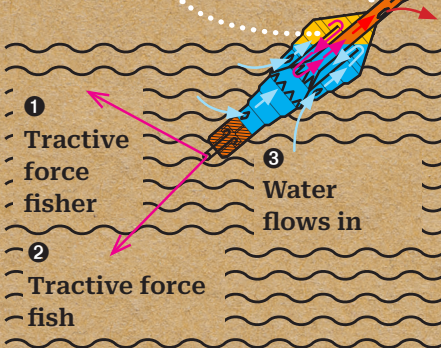

Re-adjusting Sensitivity

⑤

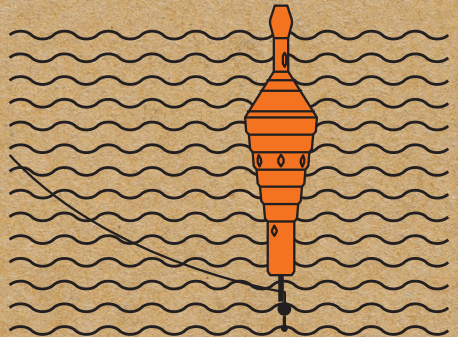

As the air escapes through the neck, the bite resistance is reduced

④

Air is compressed and passes through the bottle siphon

The desired **sensitivity** can be **adjusted** by plucking several times (until only the tip of the neck protrudes from the water).

When the line is plucked 1 or the fish bites 2, the Clever Float is tilted. This causes water to push in 3 and the air escapes via the bottle siphon through the neck 4/5.

The bite resistance is reduced (up to the possible complete sinking of the Clever Float - see next page).

A glowstick can be permanently attached to enlarge the silhouette for better visibility.

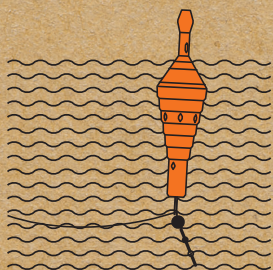

Observe the safety instructions for the glowsticks..

Only Clever Floats can do that: Float and Dive!

Hint

**Preferably use for bottom fishing:
Micro Float und Mini Float**

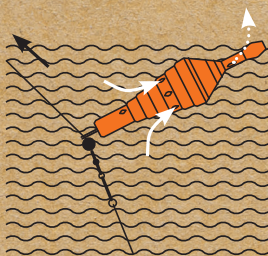

Lowered rod tip
for guiding

The Clever Floats can be guided precisely to the desired position.

A strong inclination of the Clever Float must be avoided - otherwise water will flow in.

This means:

With the rod tip lowered (possibly even under water), guide the Clever Float slowly.

Steep rod tip for sinking

When the desired position is reached and the the Clever Float is already deep in the water, all you need to do is give it a short, strong pull (preferably with a steep rod tip).

Due to the inclined position, more water flows in via the inlet openings and the remaining air escapes.

The Clever Float sinks to the bottom.

If necessary, the plucking must be repeated several times until the load-bearing point is exceeded.

If you want to let the Clever Float sink to the bottom with your cast immediately, you can fill it completely with water beforehand.

Video: Introducing Micro Float

Micro Float

**A little practice
makes perfect.**

Tight lines and happy fishing!

Care Guide

The presented range of Clever Float products represents the latest advancements in fishing gear, manufactured using high end 3D printing technology.

Clever Floats should not be exposed to permanent temperatures exceeding 50°C outside of the water. Prolonged exposure to UV light over several days should also be avoided.

After completing your fishing session, shake out the remaining water from the Clever Float through the lower openings at the thickened end. If heavily soiled, rinse thoroughly with clean water.

The fishing equipment of the CF series is exclusively intended for hobby and recreational fishing purposes and must not be used for any other applications.

clever float

**Tight lines and
happy fishing,
Yours sincerely,
Sabine**
